

Denture Home Care Management

Denture Home Care Recommendations:

- Your beautiful new denture has been hand crafted to look as natural as possible. The individual colors in the gums will last if you properly care for them.
- To protect the colors, NO NOT use bleaching products or any denture cleaners that have bleach in them. Brushing with a toothbrush and hot soapy water will remove any daily debris.
- For additional cleaning or for occasional longer soaking, we recommend using white vinegar (see below) which cleans while protecting the color tones.

Denture Care Specifics:

- Use a solution of 1:1 water and white vinegar.
- Soak denture in the vinegar solution for approximately 15 minutes while you are showering. This will make hard calculus/tarter deposits soft enough to remove with a brush.
- Occasionally for stubborn stains, leave overnight in a cold solution of water and vinegar.
- Regardless of the cleaning protocol used, the temperature of the soaking solution should NEVER exceed 122° F/ 50°C
